SUMMARY

Full-Stack Developer who takes systems from "it works" to production-grade — release ownership, data-integrity fixes, and security remediation on a live internal platform serving a growing team. Built a multi-provider API integration layer (five distinct ad-platform auth models) with an AI-generated reporting feature, backed by an automated test suite. Comfortable owning a system end-to-end: schema design, Row-Level Security, concurrency bugs, and the release pipeline that gates what reaches production.

WORK EXPERIENCE

Full Stack Developer

September 2025 - Present

- Took over release ownership of an internal reporting platform (10–20 daily users): instituted CODEOWNERS, required PR checks, and branch protection as sole gatekeeper to production; refactored a 3,404-line legacy component into a 975-line component plus a reusable hook.
 - Fixed a concurrency bug causing silent rate-limit failures by isolating cron execution onto its own identity via AsyncLocalStorage, adding per-identity quota instrumentation so the failure is now observable instead of a silent 403.
 - Closed a data-integrity gap with a 5-layer fallback chain and a strict-mode path that fails loudly instead of returning corrupted state, after a single API error could silently wipe client records; led a security audit that remediated an XSS vulnerability and unvalidated file uploads.
 - Migrated production data from ad-hoc files and Google Drive to Supabase — designed the schema, wrote Row-Level Security policies, and cut the platform over to a Supabase-first read path across six major features.
 - Built a multi-provider integration layer normalizing five ad-platform API auth models into one typed contract, plus an AI-generated report-summary feature with persisted history — covered by an automated test suite (including database-failure fallback paths) and hardened for concurrent load (query caps, serverless-tuned connection pooling, scoped rate limiting).
-

PROJECTS

PoultryGuard | Python, Arduino, IoT Cloud, YOLO, OpenCV, C++

- Built a real-time IoT monitoring system using thermal imaging and YOLO-based object detection to identify early signs of heat stress in poultry — achieving 90% detection reliability across temperature and motion datasets.
- Integrated cloud automation that reduced poultry mortality risk by up to 50% in pilot farm tests; implemented SMS/email alerting that enabled farmers to respond to anomalies 3× faster.
- Optimized model inference and data transmission pipeline, cutting latency from ~5 seconds to 2 seconds for reliable real-time monitoring.

Internal Document Approval Platform | Next.js, React, TypeScript, Supabase

- Sole builder of a BPM-style approval workflow — submission wizard, multi-approver chains, department routing, PDF signature placement, realtime notifications — from schema to production in two months.
 - Designed a 7-table schema with 25 Row-Level Security policies; authorization lives in the database, not scattered across route handlers.
-

EDUCATION

Bachelor of Science in Computer Engineering

Aug 2021 - Nov 2025

Far Eastern University Institute of Technology (FEU Tech)

- Elite Scholar, Dean's Lister, Top Performing Student, MRSP National Robotics Champion, PhilDev & DICT Ideathon Finalist
-

SKILLS

- **Frontend:** React, Next.js 14 (App Router), TypeScript, Vue.js, Tailwind CSS, WordPress
- **Backend:** Node.js, Express.js, Laravel, PHP, Supabase, PostgreSQL, MongoDB, MySQL, REST APIs
- **Analytics:** Google Analytics 4, Google Tag Manager, Meta Pixel, TikTok Pixel, custom data layers
- **DevOps & Tools:** Git, GitHub, Vercel, Jira, CI/CD, n8n, Arduino Cloud
- **AI-Assisted Development:** Claude Code, Lovable, Cursor — prompt engineering, agentic coding workflows
